Patent No. 6280940

GENERAL INFORMATION:
APPLICANT: Potts, Karen E.
APPLICANT: Jackson, Roberta L.
APPLICANT: Patick, Amy K.
APPLICANT: Patick, Amy K.
APPLICANT: Patick, Amy K.
APPLICANT: Patick, Amy K.
ITILE OF INVENTION: OF INHIBITORS OF THE HEPATITIS C VIRUS PROTEASE
FILE REFERENCE: 0125-0005A
CURRENT APPLICATION NUMBER: US/09/263,933
CURRENT APPLICATION NUMBER: 09129,611
EARLIER APPLICATION NUMBER: 09129,611
EARLIER FILING DATE: 1998-08-05
NUMBER OF SEQ ID NOS: 33
SOUTWARE PATENTING DATE: 1998-08-05
NUMBER: DESCRIPTION OF SEQ ID NOS: 33
SOUTWARE PATENTIN Ver. 2.0
LENGTH: 1692
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 15

WO200248375-A2 Synthetic. Hepatitis C virus. HCV protease NS2/3 truncation mutant 904-1206 ABG32183; ABG32183 standard; (first entry) protein; 303 Ã

The invention relates to an isolated polypeptide consisting of a full-length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred to also as NS2/3 (810-1206)), or its truncation, having as its N-terminal residue amino acid 810 to 906, or having a minimal amino acid sequence from residues 904 to 1206 of hepatitis C virus (HCV) 1b-40 full-length NS2/3 protease. Also included are (1) a composition (C) comprising an isolated HCV NS2/3 protease selected from full length NS2/3 protease, or its truncation or a mutated sequence, where the protease is in a solution comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide

Novel polypeptide for screening inhibitors of non-structural proteases useful as therapeutic agents against hepatitis C virus, comprises full length non-structural protease, or its truncation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC appearing as ABG32198; (3) producing (M1) a refolded, inactive HCV NS2/3 CC protease, involving isolating the protease in the presence of a CC chaotropic agent, refolding the isolated protease by contacting it with a CC reducing gent, and LDAO in the presence of reduced concentration of the CC chaotropic agent or a polar additive; (4) producing (M2) an active NS2/3 CC protease, involving diluting refolded inactive NS2/3 protease in a medium CC containing an activation detergent to induce auto-cleavage of the NS2/3 CC protease; (5) measuring (M3) the auto-cleavage activity of NS2/3 CC protease; involving incubating the active NS2/3 protease and produce cleavage products or their fragments, and measuring the presence or CC absence of uncleaved NS2/3 protease, cleavage products or their fragments, and measuring the presence of cc and (6) screening a potential inhibitor of auto-cleavage activity of an active NS2/3 protease, involving carrying out M3 in the presence of, or CC absence of the potential inhibitor, comparing the amount of uncleaved NS2/3 protease, cleavage products or their fragments. The protease is CC useful for detailed biochemical characterisation of the enzymes and in the development of in vitro assays for screening novel inhibitors of NS2/3 protease which are useful as therapeutic agents against HCV content sequence represents the NS2/3 truncation mutant 904-1206 (numbered relative to the full length NS2/3 protean)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches 303;

The invention relates to an isolated polypeptide consisting of a full-
CC length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred
CC to also as NS2/3 (810-1206)), or its truncation, having as its N-terminal
CC residue amino acid 810 to 906, or having a minimal amino acid sequence
CC from residues 904 to 1206 of hepatitis C virus (ECV) 1b-40 full-length
CC NS2/3 protease, Also included are (1) a composition (C) comprising a sufficient concentration of lauryldethylamine oxide (LDAO)
CC to prevent auto-cleavage of the protease; is in a solution
CC comprising a sufficient concentration of lauryldethylamine oxide (LDAO)
CC to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide
CC appearing as NB32198; (3) producing (M1) a refolded, inactive HCV NS2/3
CC protease, involving isolating the protease in the presence of a
CC chaotropic agent, refolding the isolated produced concentration of the
CC containing an activation detergent to induce auto-cleavage of the NS2/3
CC protease, involving diluting refolded inactive NS2/3 protease in amedium
CC containing an activation detergent to induce auto-cleavage of the NS2/3
CC protease, involving inclusting the auto-cleavage activity of NS2/3
CC protease, involving inclusting the auto-cleavage activity of NS2/3
CC protease, involving inclusting the auto-cleavage activity of NS2/3
CC protease, involving inclusting the auto-cleavage activity of NS2/3
CC protease, involving apotential inhibitor, comparing the presence of, or
CC absence of uncleaved NS2/3 protease, containing an active NS2/3 protease and produce
CC cleavage products or their fragments, and measuring the presence of, or
CC second of the potential inhibitor, comparing the amount of uncleaved
CC NS2/3 protease, involving carrying out M3 in the presence of, or
CC second of the potential inhibitor, comparing the amount of uncleaved
CC NS2/3 protease involving carrying out M3 in the presence of, or
CC protease with the comparing the products or their fragments
CC protease with the compari
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 200

The invention relates to an isolated polypeptide consisting of a full-
length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred
to also as NS2/3 (810-1206)), or its truncation, having as its N-terminal
residue amino acid 810 to 906, or having a minimal amino acid sequence
from residues 904 to 1206 of hepatitis C virus (HCV) 1b-40 full-length
NS2/3 protease. Also included are (1) a composition (C) comprising an
isolated HCV NS2/3 protease selected from full length NS2/3 protease, or
its truncation or a mutated sequence, where the protease is in a solution
comprising a sufficient concentration of lauryldiethylamine oxide (LDAo)
to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide
appearing as AGG32198; (3) producing (M1) a refolded, inactive HCV NS2/3
protease, involving isolating the isolated protease by contacting it with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel

Hepatitis C virus

WO200248375-A2

```
The invention relates to an isolated polypeptide consisting of a full-college to also as NS2/3 (810-1206)), or its truncation, having as its N-terminal CC residue amino acid 810 to 906, or having a minimal amino acid sequence college from residues 904 to 1206 of hepatitis C virus (HCV) 1D-40 full-length CC NS2/3 protease. Also included are (1) a composition (C) comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) CC comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) CC comprising as sufficient concentration of lauryldiethylamine oxide (LDAO) CC comprising as ABG32198; (3) prodease; (2) a NS2/3 inhibitory peptide concentration of lauryldiethylamine oxide (LDAO) CC chaotropic agent, and LDAO in the protease in the presence of a twith a C reducing agent or a polar additive; (4) producing (M1) an active NS2/3 CC protease, involving isolating the isolated protease by contacting it with a C reducing an activation detergent to induce auto-cleavage of the NS2/3 protease in a medium C containing an activation detergent to induce auto-cleavage of NS2/3 protease in a medium C containing an activation the auto-leavage activity of NS2/3 CC protease, involving incubating the active NS2/3 protease and produce c absence of uncleaved NS2/3 protease, involving incubating the active NS2/3 protease and produce c absence of uncleaved NS2/3 protease, cleavage products or their fragments, and measuring the presence or active NS2/3 protease, involving carrying out M3 in the presence of c absence of the potential inhibitor, comparing the amount of uncleaved CNS2/3 protease, cleavage products or their fragments of the presence of the development of in vitro assays for screening novel inhibitors of state activity of an activative of active NS2/3 protease in a medium c their fragments. The protease is contained to the full length NS2/3 truncation mutant 855-1206 c liver disease. M is useful for high level production of protease. The protease.
                                                                                                                                                멂
                                                                                                                                                                                                                                                                                                                          Matches 303;

The invention relates to an isolated polypeptide consisting of a full-length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred CC length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred CC slowers) as NS2/3 (810-1206)), or its truncation, having as its N-terminal CC residue amino acid 810 to 906, or having a minimal amino acid sequence (NS2/3 protease) also included are (1) a composition (C) comprising an isolated HCV NS2/3 protease selected from full length NS2/3 protease, or its truncation or a mutated sequence, where the protease is in a solution (C) comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) (C) prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide appearing as ABG32198; (3) producing (M1) a refolded, inactive HCV NS2/3 (C) protease, involving isolating the protease in the presence of a (C) chaotropic agent, and LDAO in the presence of reduced concentration of the containing an activation detergent to induce auto-cleavage of the NS2/3 (C) protease, involving incubating the active NS2/3 protease in a medium (C) measuring (M3) the auto-cleavage activity of NS2/3 (C) protease, involving incubating the active NS2/3 protease and produce (C) measuring (M3) the auto-cleavage activity of NS2/3 (C) protease, involving the active NS2/3 protease and produce cleavage products or their fragments, and measuring the presence of containing a potential inhibitor of auto-cleavage activity of an active NS2/3 protease, involving carrying out M3 in the presence of, or absence of the potential inhibitor, comparing the amount of uncleaved is sense of the potential inhibitor, comparing the amount of uncleaved is sense of the potential inhibitor, comparing the amount of uncleaved is sense in the presence of, or active NS2/3 protease, cleavage products or their fragments or their fragments. The protease is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

Claim 41; Page 59-60; 67pp; English

Collength HCV (hepatitis to an isolated polyperiode consisting of a rulfCC length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred
CC residue amino acid 810 to 906, or having a minimal amino acid sequence
CC from residues 904 to 1206 of hepatitis C virus (HCV) 11-40 full-length
CC NS2/3 protease. Also included are (1) a composition (C) comprising an
CC isolated HCV NS2/3 protease selected from full length NS2/3 protease.
CC comprising a sufficient concentration of lawyldiethylamine oxide (LDAO)
CC or prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide
CC protease, involving isolating the isolated protease by contacting it with a
CC reducing agent, refolding the isolated protease by contacting it with a
CC reducing agent, and LDAO in the presence of reduced concentration of the
CC chaotropic agent or a polar additive; (4) producing (M1) an active NS2/3
CC protease; (5) measuring (M3) the auto-cleavage activity of NS2/3
CC protease; involving incubating the active NS2/3 protease in a medium
CC containing an activation detergent to induce auto-cleavage of the NS2/3
CC protease; involving incubating the active NS2/3 protease and produce
CC leavage products or their fragments, and measuring the presence or
CC absence of uncleaved NS2/3 protease, cleavage products or their fragments, and measuring the presence or
CC active NS2/3 protease, cleavage products or their fragments of uncleaved
CC NS2/3 protease, cleavage products or their fragments. The protease and in
CC useful for detailed biochemical characterisation of the enzymes and in
CC the development of in vitro assays for screening novel inhibitors of
CC useful for detailed biochemical characterisation of the enzymes and in
CC the development of in vitro assays for screening novel inhibitors of
CC useful for detailed biochemical characterisation of the enzymes and in
CC the development of in vitro assays for screening aspainst HCV
CC infection (which causes chronic liver disease, cirrhosis and end-stage
CC infection for the p invention relates to an isolated polypeptide consisting of 5th HCV (hepatitis C virus) non-structural (NS)2/3 protease a full-

Sequence 393 AA,

```
The invention relates to an isolated polypeptide consisting of a full-color of the also as NS2/3 (810-1206)), or its truncation, having as its N-terminal cresidue amino acid 810 to 906, or having a minimal amino acid sequence from residues 904 to 1206 of hepatitis C virus (HCW) lb-40 full-length CNS2/3 protease. Also included are (1) a composition (C) comprising as its notluded are (1) a composition (C) comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) CC to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide composition (S) comprising as protease, involving isolating the protease in the protease of a chaotropic agent, refolding the isolated protease by contacting it with a creducing agent or a polar additive, (4) producing (M1) an active NS2/3 containing an activation detergent to induce auto-cleavage of the NS2/3 protease in a medium containing an activation detergent to induce auto-cleavage of the NS2/3 containing an activation detergent to induce auto-cleavage of the NS2/3 protease; (5) measuring (M3) the auto-leavage activity of NS2/3 containing an activation detergent to induce auto-cleavage of the NS2/3 protease, involving incubating the active NS2/3 protease and produce cleavage products or their fragments, and measuring the presence of active NS2/3 protease, involving carrying out m3 in the presence of cleavage products or their fragments, and measuring the amount of uncleaved (NS2/3 protease, cleavage products or their fragments of the presence of or their fragments. The protease is involving carrying out m3 in the presence of, or active NS2/3 protease, involving carrying out m3 in the presence of, or active NS2/3 protease, involving carrying out m3 in the presence of, or active NS2/3 protease, oleavage products or their fragments. The protease is cleavage activity of an active NS2/3 protease of manual streptanion and safety active active active active active active active active active active active active active active active active active active active activ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HCV; enzyme; protease; NS2/3 (810-1206); hepatitis C virus infection; chronic liver disease; cirrhosis; end-stage liver disease; virucide; hepatotropic; antiinflammatory; lauryldiethylamine oxide; LDAO;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polypeptide for screening inhibitors of non-structural proteases useful as therapeutic agents against hepatitis C virus, comprises full length non-structural protease, or its truncation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Thibeault D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 15-DEC-2000; 2000US-0256031P

HCV protease NS2/3 truncation 904-1206/His952Ala.

, 4

```
containing an activation of the protease in a medium general for protease, involving the protease is an activation of the protease, in a metative (M2/3) protease selected from the protease is an activation of the protease in a medium general for comprising an unitated sequence, where the protease is in a solution comprising as fift into protease, or comprising a sufficient concentration of lauryldisthylamine oxide (LDAO) or to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide appearing as ABG32198; (3) producing (M1) a refolded, inactive HCV NS2/3 comprising a protease, involving isolating the protease in the presence of a reducing agent, refolding the protease in the presence of a containing an activation detergent to induce auto-cleavage of the NS2/3 containing an activation detergent to induce auto-cleavage of the NS2/3 protease; (5) measuring (M3) the auto-cleavage of the NS2/3 protease; (5) measuring (M3) the auto-cleavage of the NS2/3 protease; (6) screening a potential inhibitor, and measuring the protease produced by M2 containing an activate NS2/3 protease; (5) measuring the auto-cleavage of NS2/3 protease and produce containing a potential inhibitor, comparing the presence of active NS2/3 protease, involving incubating the active NS2/3 protease and produce containing a potential inhibitor, comparing the amount of uncleaved NS2/3 protease, cleavage products or their fragments, and measuring the presence of, or cative NS2/3 protease, cleavage products or their fragments of auto-cleavage activity of an active NS2/3 protease, cleavage products or their fragments. The protease is credit for detailed biochemical characterisation of the enzymes and in the development of in vitro assays for screening novel inhibitors of confection (which causes chronic liver disease, cirrhosis and end-stage in the development of invitro assays for screening novel inhibitors of confection (which causes chronic liver disease, cirrhosis and end-stage in the protease. The confection of the cause of the NS2/3 t

Example 7; Fig 8; 67pp; English

The invention relates to an isolated polypeptide consisting of a full-clearly the CV (hepatitis C virus) non-structural (NS)2/3 protease (referred CC to also as NS2/3 (810-1206)), or its truncation, having as its N-terminal CC residue amino acid 810 to 906, or having a minimal amino acid sequence CC from residues 904 to 1206 of hepatitis C virus (HCV) 1b-40 full-length CC NS2/3 protease. Also included are (1) a composition (c) comprising a nutrated sequence, where the protease is in a solution comprising a sufficient concentration of lauryldiathylamine oxide (IDAO) CC to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide capearing as 88032198; (3) producing (M1) a refolded, inactive HCV NS2/3 protease, involving isolating the protease in the presence of a reducing agent, refolding the isolated protease by contacting it with a cc chaotropic agent, and LDAO in the presence of reduced concantration of the NS2/3 protease; (5) measuring (M2) an active NS2/3 protease; (5) measuring diluting refolded inactive NS2/3 protease, involving incubating the auto-cleavage activity of NS2/3 protease, involving incubating the auto-cleavage activity of NS2/3 protease, involving incubating the active NS2/3 protease produced by M2 capearing (M2) an active NS2/3 protease, involving incubating the active NS2/3 protease and produce cleavage produces or their fragments, and measuring the presence of containing a potential inhibitor of auto-cleavage activity of an active NS2/3 protease, involving carrying out M3 in the presence of, or absence of the potential inhibitor, comparing the amount of uncleaved containing the potential inhibitor of auto-cleavage activity of an active NS2/3 protease is involving carrying out M3 in the presence of, or absence of the potential inhibitor of auto-cleavage activity of an active NS2/3 protease with a residual produce of active to a capear and active to a capear and active to a capear and active to a capear and active to a capear and active to a capear and active to a capear and acti

cresidue amino acid 810 to 906, or having a minimal amino acid sequence from residues 904 to 1206 of hepatitis C virus (HCV) 1b-40 full-length CC MS2/3 protease. Also included are (1) a composition (C) comprising an CC isolated HCV NS2/3 protease selected from full length NS2/3 protease, or its truncation or a mutated sequence, where the protease is in a solution comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) to prevent auto-cleavage of the protease; (2), a NS2/3 inhibitory peptide appearing as ABG32198; (3) producing (M1) a refolded, inactive HCV NS2/3 protease, involving isolating the protease in the presence of a CC chaotropic agent, refolding the isolated protease by contacting it with a CC chaotropic agent or a polar additive; (4) producing (M2) an active NS2/3 (CC protease, involving diluting refolded inactive NS2/3 protease; (5) measuring (M3) the auto-cleavage of the NS2/3 (CC protease, involving incubating the active NS2/3 protease produced by M2 protease, involving incubating the active NS2/3 protease and produce colleavage products or their fragments, and measuring the presence of a sheence of uncleaved NS2/3 protease, cleavage products or their fragments, and measuring the presence of colleavage products or their fragments, and measuring the amount of uncleaved NS2/3 protease, cleavage products or their fragments of the presence of or active NS2/3 protease, cleavage products or their fragments. The protease is cuseful for detailed biochemical characterisation of the enzymes and in cuter disease. Which causes chronic liver disease, cirrhosis and end-stage cliver disease. M1 is useful for high level production of protease. The colleavage produce tepresents the NS2/3 truncation 904-1206 mutant cc deltaled of autocatalytic activity

                                                                                                                                                                                                                                                                                                                                                                                                               240
```

```
The invention relates to an isolated polypeptide consisting of a full-CC length HCV (hepatitis C virus) non-structural (NS)2/3 protease (referred CC to also as NS2/3 (810-1206)), or its truncation, having as its N-terminal CC residue amino acid 810 to 906, or having a minimal amino acid sequence CC from residues 904 to 1206 of hepatitis C virus (HCV) lb-40 full-length CC (NS2/3) protease. Also included are (1) a composition (C) comprising an CC isolated HCV NS2/3 protease selected from full length NS2/3 protease, or CC comprising a sufficient concentration of lauryldiethylamine oxide (LDAO) CC to prevent auto-cleavage of the protease; (2) a NS2/3 inhibitory peptide CC appearing as ABG22198; (3) producing (M1) a refolded, inactive HCV NS2/3 protease, involving isolating the isolated protease by contacting it with a CC chaotropic agent or a polar additive; (4) producing (M2) an active NS2/3 cc protease, involving diluting refolded inactive CO contentration of the cc chaotropic agent or a polar additive; (4) producing (M2) an active NS2/3 protease; (5) measuring (M3) the auto-cleavage of the NS2/3 protease in a medium CC cleavage products or their fragments, and measuring the presence of a protease; (5) measuring (M3) the auto-cleavage of NS2/3 protease produced NS2/3 protease, involving incubating the active NS2/3 protease produced by M2 cc active NS2/3 protease, involving incubating the active NS2/3 protease produced or their fragments, and measuring the presence or absence of uncleavage products or their fragments or their fragments of cleavage activity of an active NS2/3 protease, involving carrying out M3 in the presence of, or absence of the potential inhibitor, comparing the amount of uncleaved consentual inhibitor, comparing the amount of uncleaved consents of the protease in a steril for their fragments. The protease is cleavage activity of an active NS2/3 protease is in a schilar for high level production of the enzymes and in the decrease in the interdiscent of the consents and end-stage consents agains

Claim 3; Page; 140pp; English. New self-replicating RNA molecules from Hepatitis C virus (HCV), wh possess enhanced transduction or replication efficiency, useful for evaluating potential inhibitors of HCV replication.

Kukolj G,

Pause A;

2002-575382/61.

The invention describes a self-replicating hepatitis C virus (HCV)

C polynucleotide molecule comprising a 5'-non translated region (NTR),

Where guanine at position 1 is substituted for adenine, a HCV polyprotein

C region coding for a HCV polyprotein; and a 3'-NTR region. The self
C replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating

C potential inhibitors of HCV replication. The HCV RNA molecule is also

C useful for efficiently establishing cell culture replication. The self
C replicating polynucleotide molecule contains a 5'-NTR, where G at

C position 1 is substituted for A, and therefore provides an alternative to

C existing systems comprising a self-replicating HCV RNA molecule that, in

C conjunction with mutations in the HCV non-structural region, such as the

C (2042)C/R mutations, transduces and/or replicates with greater

C efficiency. This amino acid sequence represents a mutant of the hepatitis

C virus replicon APGKI2 and contains the viral protease NS2/3, procease

C complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B. Note:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a self-replicating hepatitis C virus (HCV) CC polynucleotide molecule comprising a 5'-non translated region (NTR), CC where guanine at position 1 is substituted for adenine, a HCV polyprotein CC region coding for a HCV polyprotein; and a 3'-NTR region. The self-CC replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating CC constall inhibitors of HCV replication. The HCV RNA molecule is also CC useful for efficiently establishing cell culture replication. The self-CC replicating polynucleotide molecule contains a 5'-NTR, where G at CC position 1 is substituted for A, and therefore provides an alternative to CC existing systems comprising a self-replicating HCV RNA molecule that, in CC conjunction with mutations in the HCV non-structural region, such as the CC (2042) C/R mutations, transduces and/or replicates with greater CC efficiency. This amino acid sequence represents a mutant of the hepatitis CC virus replicate No APGK12 and contains the viral protease NS2/3, protease CC rhis sequence was and RNA-dependent RNA polymerase NS2B. Note: Complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS2B. Note: CR the claims of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches 288;

                                                                                                                                                                                                                                                                                                                                                                                                           Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a self-replicating hepatitis C virus (HCV) CC polynucleotide molecule comprising a 5'-non translated region (NTR), CC where guanine at position 1 is substituted for adenine, a HCV polyprotein region coding for a HCV polyprotein; and a 3'-NTR region. The self-coding for a HCV polyprotein; and a 3'-NTR region. The self-coding Hepatitis C virus (HCV) RNA molecule is useful for evaluating pofential inhibitors of HCV replication. The HCV RNA molecule is also useful for efficiently establishing cell culture replication. The self-coding polynucleotide molecule contains a 5'-NTR, where G at position 1 is substituted for A, and therefore provides an alternative to conjunction with mutations in the HCV non-structural region, such as the CC existing systems comprising a self-replicating HCV RNA molecule that, in CC conjunction with mutations in the HCV non-structural region, such as the CC virus replicon APGK12 and contains the viral protease with greater CC efficiency. This amino acid sequence represents a mutant of the hepatitis CC virus replicon APGK12 and contains the viral protease NS2/3, protease CC rhis sequence does not appear in the specification but has been created CC the wild type sequence shown in ABG30580 using information given in CC consplex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B. Note:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a self-replicating hepatitis C virus (HCV) copolynucleotide molecule comprising a 5'-non translated region (NTR), where guanine at position 1 is substituted for adenine, a HCV polyprotein region coding for a HCV polyprotein; and a 3'-NTR region. The self-replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating potential inhibitors of HCV replication. The HCV RNA molecule is also useful for efficiently establishing cell culture replication. The self-replicating polynucleotide molecule contains a 5'-NTR, where G at position 1 is substituted for A, and therefore provides an alternative to existing systems comprising a, self-replicating HCV RNA molecule that, in conjunction with mutations in the HCV non-structural region, such as the G(2042)C/R mutations, transduces and/or replicates with greater cefficiency. This amino acid sequence is encoded by the hepatitis C virus replicates with greater and contains the viral protease NS2/3, protease complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New self-replicating RNA molecules from Hepatitis C virus (HCV), which possess enhanced transduction or replication efficiency, useful for evaluating potential inhibitors of HCV replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 49-58; 140pp; English.

A;Note: this sequence is inconsistent with the nucleotide translation

A;Note: this sequence is inconsistent with the nucleotide translation

A;Note: the authors translated the codon AGG for residue 43 as Pro, TGG for residue 320

as Trp, and TTC for residue 771 as Ser

A;Note: sequence extracted from NCBI backbone (NCBIN:121747, NCBIP:121748)

N;Contains: capsid protein C; envelope protein M; hepaciv
protein N84a; nonstructural protein N84b; nonstructural
C;Species: hepatitis C virus
A;Note: host Homo sapiens (man)
C;Date: 31-Dec-1992 #sequence_revision 31-Dec-1992 #text_
C;Note: 33-Dec-1992 #sequence_revision 31-Dec-1992 #text_
A;Description: Genomic struc
A;Reference number: A36814
A;Accession: A36814
A;Molecule type: genomic RNA
A;Residues: 1-3011 <INC>

genome polyprotein - hepatitis C virus (isolate HC-J6)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nc
protein NS4a; nonstructural protein NS5b; nonstructural protein NS5
C;Spacies: hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 17-Nov-2000
C;Accession: JQ1303
R;Okamoto, H.; Okada, S.; Sugiyama, Y.; Kurai, K.; Iizuka, H.; Machida, A.; Miya
J. Gen. Virol. 72, 2697-2704, 1991
A;Title: Nucleotide sequence of the genomic RNA of hepatitis C virus isolated fr
A;Reference number: JQ1303
A;Accession: JQ1303

genome polyprotein - hepatitis C virus (strain HC-J8)

yenome polyprotein C; envelope protein M; hepacivirin (EC 3.4.21.98)

N; Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98)

protein NS4a; nonstructural protein NS4b; nonstructural protein NS5

C; Species: hepatitis C virus

C; Date: 31.Dec-1992 #sequence revision 31-Dec-1992 #text_change 19-Jan-2001

C; Accession: A40250; PQ0397; PQ0559

R; Okamoto, H.; Kurai, K.; Okada, S.I.; Yamamoto, K.; Lizuka, H.; Tanaka, T.

Virology 188, 331-341, 1992

A; Title: Full-length sequence of a hepatitis C virus genome having poor hom:
A; Reference number: A40250; MUID:92230232; PMID:1314459

A; Accession: A40250 3.4.21.98) NS5

L Virus Res. 23:39-53(1992).

L Virus Res. 23:39-53(1992).

C -!- FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are
C hydrophobic, suggesting a possible membrane-related function. NS3

C and NS5 may play a role in the viral RNA replication.

C encursor polyprotein, commonly with Asp or Glu in the viral
C precursor polyprotein, commonly with Asp or Glu in the P6

C position, Cys or Thr in P1 and Ser or Ala in P1'.

C -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +

C {RNA}(N).

C -!- SUBUNIT: The virion of this virus is a nucleocapsid covered by a

C lipoprotein envelope. The envelope consists of two proteins:
C procein M and glycoprotein E. The mucleocapsid is a complex of
protein C and mRNA.

C -!- SIMILARITY: THE PROTEASE BELCNGS TO PEPTIDASE FAMILY S29. DT 01-APR-1993 (Rel. 25, Created)
